(54) Title: HEAT SEALABLE FILMS

(57) Abstract

This invention relates to a film comprising a blend comprising: (i) a homopolymer of ethylene having an Mw/Mn of 3 or less or a copolymer of ethylene and up to 50 weight % of a C₃ to C₂₀ olefin having a CDBI of 50 % or more, (ii) a homopolymer of propylene or copolymer of propylene and up to 50 weight % of a comonomer, and (iii) a polymer produced in a high pressure process using a free radical initiator. In a preferred embodiment the blend comprises mPE, LDPE and isotactic PP.

HEAT SEALABLE FILMS

Field of the Invention

This invention relates to films comprising a blend comprising metallocene polyethylene (mPE), polypropylene and free radically high pressure produced polymers.

Background of the Invention

- Polyethylene has traditionally been used as a layer in polyolefin films and packaging because of its desirable properties such as moisture impermeability good sealing behavior, good optical properties and good organoleptics. Typically polyethylene has been coextruded, laminated or otherwise bonded to other polyolefins which have better strength than polyethylene, yet do not seal as well as polyethylene. For example, in a typical multilayer film, a polypropylene layer, especially a mono or biaxially oriented polypropylene (OPP) layer, provides a high clarity, high melting, high barrier properties, combined with high stiffness, while a polyethylene layer will provide extra body to the film and will allow a low sealing temperature, meaning higher packaging speeds. However, polypropylene (PP) and polyethylene (PE) have very limited compatibility and direct sealing of polyethylene onto polypropylene film is not commonly done. When a layer of PE
- is combined with a layer of PP, extra primer may be needed. For example, extra primer is used when polyethylene, such as low density polyethylene, is coated onto polypropylene films. In addition tie layers may also be necessary.

 Coextrudable tie layers such as ethylene vinyl acetate copolymers, typically having more that 8 weight % vinyl acetate, have been extruded between PP and PE to enhance adhesion between the PE and the PP. Another solution to the compatibility problem has been to blend polypropylene into the polyethylene.
- This however has the disadvantage or creating layers that have greater haze and are thus undesirable in the industry.

Therefore there is a need in the art to provide a means to provide a polyethylene polypropylene blend for film layers that does not have haze, yet retains good mechanical properties such impact strength.

35

WO 94/26816 discloses blends of metallocene polyethylene and high molecular weight high density polyethylene for use in films.

Summary of the Invention

This invention relates to a film comprising a blend of:

(i) a homopolymer of ethylene having an Mw/Mn of 3 or less or a copolymer of 5 ethylene and up to 50 weight % of a C₃ to C₂₀ olefin, wherein the copolymer has a CDBI of 50 % or more, preferably 60% or more;

ignored when determining CDBI. For purposes of this invention a homopolymer is organization and the first defined to have a CDBI of 100%.

The C₃ to C₂₀ and C₄ to C₂₀ olefin comonomers for the polyethylene or 5 polypropylene copolymers described above may be any polymerizable olefin monomer and are preferably a linear, branched or cyclic olefin, even more preferably an α-olefin. Examples of suitable olefins include propylene, butene, isobutylene, pentene, isopentene, cyclopentene, hexene, isohexene, cyclohexene, heptene, isoheptene, cycloheptene, octene, isooctene, cyclooctene, nonene, cyclononene, decene, isodecene, dodecene, isodecene, 4-methyl-pentene-1, 3-methyl-pentene-1, 3,5,5-trimethyl hexene-1. Suitable comonomers also include dienes, trienes, and styrenic monomers. Preferred examples include styrene, α-methyl styrene, para-alkyl styrene (such as paramethyl styrene), hexadiene, norbornene, vinyl norbornene, ethylidene norbornene,

butadiene, isoprene, heptadiene, octadiene, and cyclopentadiene. 15

Preferred comonomers for the copolymer of ethylene are propylene, butene, hexene in land/or octene. The action of the profusered eldit proceditions at the first party the meaning of the alternation of the state of the advantage of the enterprise of the contractions and

The polyethylene or polypropylene copolymers described above may also contain termonomers and tetramonomers which may be one or more of the C3 to C20 olefins described above, any C4 to C30 linear, cyclic or branched dienes or trienes and any styrenic monomers such as styrene, a methyl styrene, or para-methyl styrene. Preferred examples include butadiene, pentadiene, cyclopentadiene, hexadiene, cyclohexadiene, heptadiene, octadiene, nonadiene, norbornene, vinyl norbornene, ethylidene norbornene, isoprene and heptadiene. 25

JAC 16 Commission of the State of the State

The polyethylene copolymers described above preferably have a composition distribution breadth index (CDBI) of 50 % or more, preferably above 60%, even more preferably above 70%. In one embodiment the CDBI is above 80%, even more 30 preferably above 90%, even more preferably above 95%. In another particularly preferred embodiment, the polyethylene copolymer has a CDBI between 60 and 85 %, even more preferably between 65 and 85 %.

austraco In a particularly preferred embodiment the ethylene homopolymer or copolymer has a @35.a.: CDBI of 65 to 85 %, a density of 0.915 to 0.96 g/cm² and a Mw/Min between 1 and 2.5. ensible for the source of the first of the control of the first of the source of the s

Was I Comes for a success of the

In general, the polyethylene homopolymers and copolymers described above are metallocene polyethylenes (mPE's). The mPE homopolymers or copolymers are typically produced using mono- or bis-cyclopentadienyl transition metal catalysts 10 , in combination with an activator such as alumoxane and/or a non-coordinating anion in solution, slurry, high pressure or gas phase. The catalyst and activator may be supported or unsupported and the cyclopentadienyl rings by may substituted or unsubstituted. Several commercial products produced with such catalyst/activator combinations are commercially available from Exxon Chemical 15 Company in Baytown Texas under the tradenames EXCEED™ and EXACT™ 25 For more information on the methods and catalysts/activators to produce such mPE homopolymers and copolymers see WO 94/26816; WO 94/03506; EPA 277,003; EPA 277,004; US 5,153,157; US 5,198,401; US 5,240,894; US 5,017,714; CA 1,268,753; US 5,324,800; EPA 129,368; US 5,264,405; EPA .520,732; WO 92:00333; US 5:096,867; US 5,507,475; EPA 426 637; EPA 573 403; EPA 520 732; EPA 495 375; EPA 500 944; EPA 570 982; WO91/09882; WO94/03506 and US-5,055,438 dimension of the Automotive of

The polypropylene homopolymer or copolymer preferably has an MFR (melt flow rate) of 1 to 20 as measured according to ASTM D 1238 (230 °C, 2.16 kg). In another embodiment the polypropylene homopolymer or copolymer preferably has a CDBI of 50 % or more, preferably above 60%, even more preferably above 70 %. Polypropylenes having a CDBI above 60% are available from Exxon Chemical Company in Baytown; Texas under the tradename ACHIEVETM

gravous as the meastiffing of this of hashware by this own in its

In another embodiment the polypropylene homopolymer or copolymer can be blended with any of the other propylene homopolymers or copolmyers described above. Likewise, The polyethylene homopolymers or copolymers described above for use, in the blend may be used alone, may be blended with any of the other polyethylene homopolymers or copolymers described above.

In a preferred embodiment the polymer produced in a high pressure process using a free radical initiator (High Pressure Polymer) is a polymer comprising one or more of C2 to C20 olefins and polar monomers. Preferred C2 to C20 olefins include, but are not limited to, ethylene, propylene, butene, pentene, hexene. octene, 3-methyl-pentene-1, 4-methyl-pentene-1, cyclopentene, cyclohexene. hexadiene, norbornene, isobutene, norbornadiene, pentadiene and 3.5.5-trimethyl hexene -1. Preferred polar monomers include, but are not limited to, acetates (such as vinyl acetate), acrylics (such as acrylic acid, methacrylic acid), acrylates (such as methacrylate, butylacrylate, methylmethacrylate, assertion with the control of the cont hydroxyethylmethylacrylate). Polar modifiers can also be used in high pressure

free radical process such as alcohols (such as isopropanol) or aldehydes (such as acetaldehyde). Other modifiers known in the art can also be used.

Standard and the standard

In a preferred embodiment the High Pressure Polymer is low density polyethylene (density 0.910 to less than 0.940 g/cm³, preferably 0.915 to less than 0.935 g/cm³, Even more preferably 0.920 to less than 0.935 g/cm³), a copolymer of ethylene and vinyl acetate, a copolymer of ethylene and methyl acrylate, a copolymer of acrylic acid. a copolymer of methylmethacrylate or any other polymers polymerizable by a highpressure free radical process. The LDPE preferably has up to 20 weight % of comonomer. The EVA and acrylate copolymers preferably has 20 weight % of the polar monomer or less, preferably less than 10 weight %, even more preferably less than 6 weight %. In a preferred embodiment the Melt Index of the LDPE is between 0.2 and 50 g/10 min, preferably between 0.5 and 10 g/10 min, even more preferably between 0.6 and 5 g/10 min, even more preferably between 0.6 and 2.5 g/10 min. ALTERNATURE OF THE SEA OF MICHORAR CONTROL

Many such High Pressure Polymers are commercially available. For example, LDPE made in a high pressure process is available from Exxon Chemical Company under the trade name ESCORENE TM. EVA made in a high pressure process is available from Exxon Chemical Company under the trade name ESCORENETM.

Polymethylmethacrylate made in a high pressure process is available from Exxon Chemical Company under the trade name ESCORENETM 1976 218 1300000 The first of the second and the second secon

In a preferred embodiment the polyethylene (component (i)) is present in the 35 blend at from 1 to 99 weight %, based upon the weight of the polymers in the blend, preferably the polyethylene is present at 10 to 90 weight %, even more

preferably at least 20 to 80 weight %, even more preferably at least 30 to 70 weight %, even more preferably at least 40 to 70 weight %......

- In a preferred embodiment the polypropylene (component (ii)) is present in the blend at from 1 to 99 weight %, based upon the weight of the polymers in the blend, preferably the polypropylene is present at 10 to 90 weight %, even more preferably at least 20 to 80 weight %, even more preferably at least 30 to 70 weight %, even more preferably at least 40 to 70 weight %.
- In a preferred embodiment the High Pressure Polymer (component (iii)) is present in the blend at from 1 to 50 weight %, based upon the weight of the polymers in the blend, preferably at 2 to 30 weight %, even more preferably at least 5 to 20 weight %.

The religion of the principal of the Engage and tracered and the respect control of section and as

The blends described above can also further include other polymers such as polybutene, high density polyethylene (density 0.945 to less than 0.98 g/cm³) linear low density polyethylene, medium density polyethylene (density 0.935 to less than 0.945 g/cm³), polyvinylchloride, isotactic polybutene, ABS resins, elastomers such as ethylene-propylene rubber (EPR), vulcanized EPR, EPDM, block copolymer elastomers such as SBS, nylons, polycarbonates, PET resins, crosslinked polyethylene, copolymers of ethylene and vinyl alcohol (EVOH), polymers of aromatic monomers such as polystyrene, poly-1 esters, graft

copolymers generally, polyacrylonitrile homopolymer or copolymers,

thermoplastic polyamides, polyacetal, polyvinylidine fluoride and other fluorinated elastomers, polyethylene glycols and polyisobutylene.

The blends described above may be produced by mixing the three (or more) polymers together, by connecting reactors together in series to make reactor blends or by using more than one catalyst in the same reactor to produce multiple species of polymer. The polymers can be mixed together prior to being put into an extruder or may be mixed or compounded in an extruder.

and the first of the control of the

The blends described above are typically formed into monolayer or multilayer films. These films may be formed by any of the conventional techniques known in the art including extrusion, co-extrusion, extrusion coating, lamination, blowing and casting. The film may be obtained by the flat film or tubular process which

as the state of committee polytopy and a second of the contraction of the second of the second of

WO 98/37139 PCT/US98/03597

may be followed by orientation in an uniaxial direction or in two mutually perpendicular directions in the plane of the film.

In a preferred embodiment a film of the blend is used as a sealing layer. In another preferred embodiment a film of the blend is used as that functional layer, that is to say it is used to provide mechanical strength and/or stiffness. Films of the blends described herein have excellent stiffness and mechanical strength as compared to films of the individual components.

- This invention also relates to films as described above where one or more of the layers are oriented in the transverse and/or longitudinal directions to the same or different extents. This orientation may occur before or after the individual layers are brought together. For example the blend layer can be extrusion coated or laminated onto another layer or the layers can be coextruded together into a film then oriented.
- Typically the films are oriented in the Machine Direction (MD) at a ratio of up to 15, preferably between 5 and 7, and in the Transverse Direction (TD) at a ratio of up to 15 preferably 7 to 9. However in another embodiment the film is oriented to the same extent in both the MD and TD directions. Orientation to the same extent in both directions will generally produce roughly equal mechanical properties.

In another embodiment the blend-layer is combined with one or more other layers. The other layer(s) may be any layer typically included in multilayer film structures. For example the other layer or layers may be layer to be the layer of layers may be took as th

the same of the execution frameworks the state of the second

Preferred polyolefins include homopolymers or copolymers of C₂ to C₄₀ olefins, preferably C₂ to C₂₀ olefins, preferably a copolymer of an α-olefin and another olefin or α-olefin (ethylene is defined to be an α-olefin for purposes of this invention). Preferably homopolyethylene, homopolypropylene, propylene copolymerized with ethylene and or butene, ethylene copolymerized with one or more of propylene, butene or hexene, and optional dienes. Preferred examples include thermoplastic polymers such as ultra low density polyethylene, very low density polyethylene, linear low density polyethylene, low density polyethylene, medium density polyethylene, high density polyethylene, polypropylene, isotactic polypropylene, highly isotactic as a stylene and/or butene and/or hexene, elastomers such as ethylene propylene rubber, ethylene propylene diene monomer rubber, neoprene, and blends of thermoplastic

In a preferred embodiment up to 100 µm thick monolayer films of the blend described above are characterized by a haze, as measured by ASTM 1003 condition A of 16% or less, more preferably 14% or less, more preferably 12 % or less, more preferably 10% or less, even more preferably 5% or less.

ANTEROMER PROBLEM CONTRACTOR OF THE PROPERTY OF THE

The films described herein may vary in thickness depending on the intended application, however films of a thickness from 1 to 350 µm are usually suitable. Films intended for packaging are usually from 10 to 120 µm thick. The thickness of the sealing layer is typically 0.2 to 50 µm. There may be a sealing layer on both the inner and outer surfaces of the film or the sealing layer may be present on only the inner or the outer surface.

Additives such as antiblock, antioxidants, pigments, fillers, processing aids, UV such a stabilizers, neutralizers, lubricants, surfactants and/or nucleating agents may also be present in one or more than one layer in the films. Preferred additives include silicon dioxide, titanium dioxide, polydimethylsiloxane, talc, dyes, wax, calcium stearate, carbon black, low molecular weightfresins, tackifiers, and glass beads.

s a more consequent of the application on the consequence of the conse

Lo primadario vil properir curro descro o come vice, sacriar o escribe con disconstitución.

In another embodiment the layers may be modified by corona treatment, electron beam irradiation, gamma irradiation, or microwave. In particular the corona treatment will produce a significant difference in the coefficient of friction of the two surface layers as described in US Patent Application Number USSN 08/905,211, which is incorporated by reference herein.

In a particularly preferred embodiment film of the blends described herein are cast, blown or co-extruded and the polyethylene is present at 50 to 80 weight %, the polypropylene is present at 10 to 45 weight% and polymer produced in high pressure process using a free radical initiator is LDPE and is present at 2 to 10 weight%, based upon the weight of the blend.

In another embodiment films of the blends described herein are laminated to a substrate. Preferred substrates include polypropylene, polyamide, polyester, polyethylene, or metallized substrates.

The films described herein may also comprise from 5 to 60 weight %; based upon the weight of the polymer and the resin, of a hydrocarbon resin. The resin preferably has a softening point above 100 °C, even more preferably from 130 to 180 °C, even more

E SE DO MATERIALS: 2 CTOS OF SET OF PRINCIPLES COST (SET CARE MY VECTOR ECD 109 is an ethylene hexene copolymer produced in the gas phase having about 4.1 weight % hexene, a melt index of about 0.8 g/10min, a CDBI of about

59, an Mw/Mn of about 2.3 and a density of about 0.928 g/cm³, sold under the 15 tradename EXCEEDTM by Exxon Chemical Company in Baytown, Texas.

. 10 Company of the second company second at the figure and a gable to be all

ECD 103 is an ethylene hexene copolymer produced in the gas phase having approximately 7.6 weight % hexene, a melt index of about 1 g/10min, a Mw/Mn of about 2.3, a CDBI of about 67% and a density of about 0.917 g/cm³, sold under the tradename EXCEED™ by Exxon Chemical Company in Baytown, Texas. of the land country weight 26 of the land of the land of the land.

But to Property and and

ECD 202 is an ethylene hexene copolymer produced in the gas phase having approximately 7.6 weight % hexene, a melt index of about 2.4 g/10min, a Mw/Mn of about 2.3, a CDBI of about 67% and a density of about 0.917 g/cm³, sold under the tradename EXCEED™ by Exxon Chemical Company in Baytown, Texas. to a contract the property and the first the second of the second of the second

PP-1 is a homopolymer of propylene having a Melt Index of about 2.9 g/10 min and a broad molecular weight distribution (Mw/Mn) sold under the trade name of 30 ESCORENE PP 4352F1 by Exxon Chemical Company

with a strain Lines on which have a record with some flower

LD-2 is a low density polyethylene having a density of about 0.922 g/cm3 and a melt index of about 0.75 g/ 10 min commercially available under the trade name Geo and ESCORENE LD 150 BW from Exxon Chemical Belgium. The months of the confidence of and the second of the second o

LL-3 is ESCORENE LLN 1201 XV a ethylene butene copolymer having a Melt Index of about 0.7 g/10 min, a density of 0.925 g/cm3 and produced in a gas phase

using a Ziegler Natta catalyst and is commercially available from Exxon Chemical Belgium.

TESTING METHODS:

Composition Distribution Breadth Index (CDBI) is measured by the procedure described in PCT publication WO 93/03093, published February 18, 1993.

Fractions having a molecular weight (Mw) less than 15,000 were ignored.

Melt Index (MI) was measured according to ASTM D 1238. (190 °C, 2.16 kg)

Density was measured according to ASTM D1505, where the sample was prepared according to ASTM D 1928/.

8 412 W 12 34 1

- Mw and Mn were measured by GPC (Gel Permeation Chromatography) on a Waters 150 gel permeation chromatograph equipped with a differential refractive index (DRI) detector and a Chromatix KMX-6 on line light scattering photometer. The system was used at 135 °C with 1,2,4-trichlorobenzene as the mobile phase. Shodex (Showa
- Denko America, Inc) polystyrene gel columns 802, 803, 804 and 805 were used. This technique is discussed in "Liquid Chromatography of Polymers and Related Materials III", J. Cazes editor, Marcel Dekker. 1981, p. 207, which is incorporated herein by reference. No corrections for column spreading were employed; however, data on generally accepted standards, e.g. National Bureau of Standards Polyethylene 1484 and
- anionically produced hydrogenated polyisoprenes (an alternating ethylene-propylene copolymer) demonstrated that such corrections on Mw/Mn (= MWD) were less than 0.05 units. Mw/Mn was calculated from elution times. The numerical analyses were performed using the commercially available Beckman/CIS customized LALLS software in conjunction with the standard Gel Permeation package. Calculations
- 25 involved in the characterization of polymers by ¹³CNMR follow the work of F. A. Bovey in "Polymer Conformation and Configuration" Academic Press, New York, 1969.
 - Dyna Impact Strength properties (Max Force, Damaging Energy, Total Energy,
- Damaging Travel, Total Travel) were measured according to DIN 53373.

 Tensile properties (Tensile at yield, elongation at yield, tensile at break, elongation at break, and Secant Modulus) were measured according to ASTM D 882. Average secant modulus is the mathematical average of the MD Secant Modulus and the TD Secant Modulus.
- 35 Elmendorf Tear Strength (N/μm) was measured according to ASTM 1922.

Endwise W. Lawer C

5

Gloss was measured according to ASTM D2457/60° contraction of the party of the contraction of the contractio

Dart Dr p was measured acording to ASTM D 1709.

Heat seal testing procedure: Seal were made on a Topwave sealing machine. The film was folded between TEFLONTM film and inserted between the sealing bars. At various the sealing bars were closed with a pressure of 0.5 MPa for 0.5 seconds. The film was removed from the Top wave machine and conditioned for a minimum of 12 hours at 23 °C ± 3 °C and 50% humidity ± 5% humidity.

Seal Strength was tested according to the following procedure. After conditioning for a minimum of 12 hours at 23 °C ± 3 °C and 50% humidity \pm 5% humidity, the seal

strength of 15mm wide sample was measured in a Zwick tensile instrument under the following conditions: speed-100 mm/min, load cell-200N, and clamp distance-50 mm.

The film was placed between the clamps and the clamps were moved apart at a speed of 100mm/min. During the rest the force (N) was recorded as a function of elongation (%). Four test specimens were measured and the average seal strength curve was

recorded. The seal strength was the force at which the test specimen failed.
